

Assemble And Disassemble A PC Practical

Slide1: PC Internal Components (Task 1) *(Note: You can use this as a simple bulleted list for your first slide of Day 5)*

- **Motherboard:** The main central circuit board that connects all hardware parts and allows them to communicate.
- **CPU (Processor):** The "brain" of the computer that executes instructions and processes data.
- **RAM (Memory):** The temporary, high-speed workspace that stores data the CPU is actively using.
- **GPU (Graphics Card):** Dedicated processor for rendering images, videos, and 3D graphics to your monitor.
- **Storage (SSD/HDD):** The permanent storage drive where your operating system, apps, and files are saved.
- **PSU (Power Supply Unit):** Converts electricity from your wall outlet into usable power for the internal components.
- **Cooling System (Fans/Heatsinks):** Dissipates the extreme heat generated by the CPU and GPU to prevent damage.

Slide 2: PC Disassembly Steps (Task 2)

1. **Power & Prep:** Unplug the power cable and move the PC to a clear, static-free table.
2. **Open Case:** Remove the screws on the back and slide off the side panel.
3. **Disconnect Cables:** Unplug the thick 24-pin power cable from the motherboard, and the SATA cables from the hard drives.
4. **Remove GPU:** Unscrew the bracket holding the graphics card, press the latch on the PCIe slot, and pull it out.
5. **Remove Storage & RAM:** Unscrew and slide out the HDD/SSD. Press the tabs on the RAM slots to pop the sticks out.
6. **Remove Motherboard:** Unscrew all the small stand-off screws holding the motherboard to the case, and carefully lift it out.

Slide 3: PC Assembly Order (Task 3)

1. **Motherboard First:** Install the CPU, RAM, and cooler onto the motherboard *before* putting it in the case (it's much easier to reach everything).
2. **Mount Motherboard:** Secure the assembled motherboard into the case.
3. **Storage:** Mount the HDD or SATA SSD into their drive bays.
4. **Power Supply (PSU):** Install the PSU and route the cables behind the motherboard tray.
5. **GPU Last:** The graphics card goes in last because it's bulky and blocks access to other small cable headers.
6. **Connect Cables:** Plug everything in (24-pin, CPU power, SATA, PCIe for GPU).

	Why it's important
Unplug Everything	Prevents electric shock and protects components from shorts.
Anti-Static Wristband	Prevents static electricity from your body from zapping and destroying sensitive parts.
Magnetic Phillips Screwdriver	Essential for dropping tiny screws into place without losing them inside the case.
Clear Workspace / Good Lighting	You need to see tiny connectors clearly and avoid knocking things off the table.
